

IP CallBox

PERSONAL

IPCallBox Personal “SIP”

The **IPCallBox Personal** is an advanced, state-of-the-art device. It allows you to use a normal analog telephone to make and receive crystal clear calls across a Broadband Internet connection.

Ideal for *Home Office Enterprise Workers* who want the freedom to work from home but without the added telephone call costs, or for *Distributed Call Centres* which require reliable, low-cost solutions, the **IPCallBox Personal** enables the convergence of voice and data onto a single IP connection, such as Broadband.

The built in call routing capabilities of the **IPCallBox Personal** mean you do not have to decide how to reach the number you want. Based on the destination telephone number, the **IPCallBox Personal** automatically decides if a call should be routed across the IP connection or across the standard telephone network. If it cannot deliver the call using the IP connection, it will seamlessly retry using the normal telephone network thus ensuring that calls always connect.

The **IPCallBox Personal** supports Microsoft's TAPI interface providing full telephony support for Customer Relationship Management applications such as ACT or Outlook. The support for TAPI also allows third party software developers to use the **IPCallBox Personal** to provide IP telephony support from within their applications.

The **IPCallBox Personal** can also be used with existing IP telephony applications such as Microsoft's Messenger service, or with third party Softphone applications such as the Cisco or Avaya Softphone clients.

You use the **IPCallBox Personal** with any standard analogue telephone, from simple handsets and DECT telephones through to sophisticated executive telephone sets.

Even when the pc is powered down, the **IPCallBox Personal** enables the telephone handset to connect directly to the telephone line, giving a fail-safe method of making emergency calls.
